

A revolutionary line of tools for hydraulic breakers

Available to the North American market by MSI of Montreal.

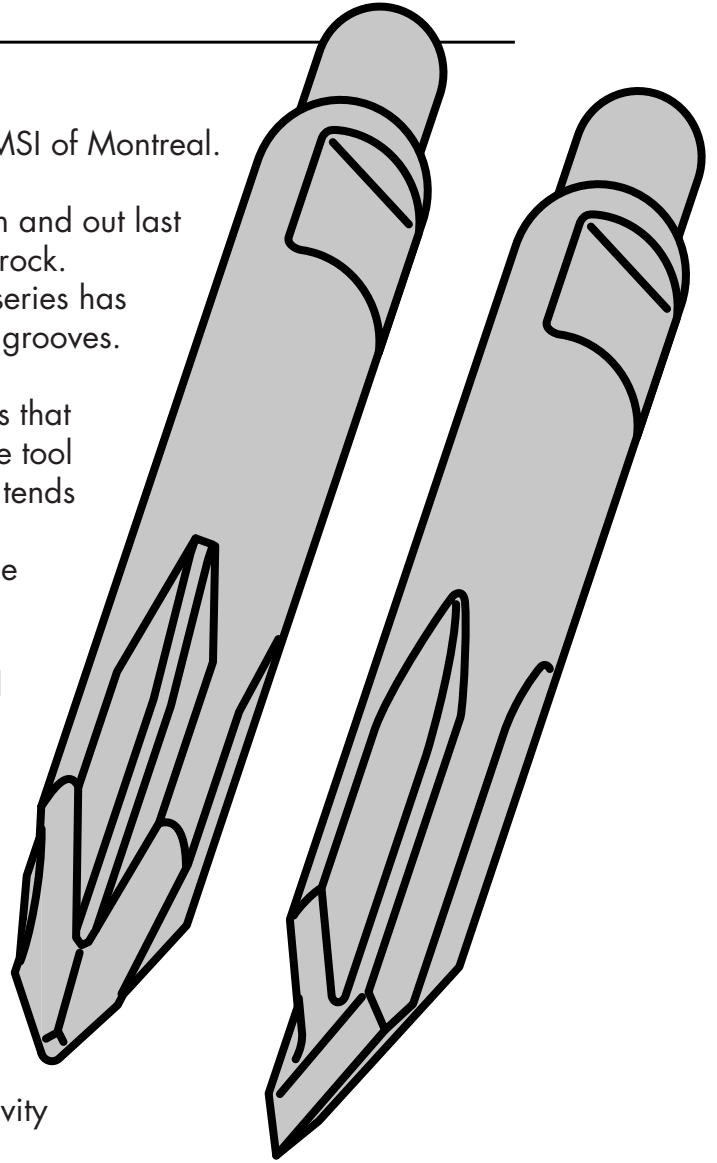

'X-profile' series is guaranteed to out perform and out last standard tools used in breaking up compact rock. Suitable for every type of hammer, this new series has a unique design feature referred to as shank grooves.

New X - ProFiles. Unlike standard tool shapes that are known to let dust accumulate between the tool head and the material being crushed, which tends to decrease striking energy, this patented grooved shape allows the dust to travel up the shank away from the tip, thereby ensuring constant tool penetration.

With the elimination of dust build-up, the tool overheats less and, therefore, maintains its strength.

What's more, the specially designed construction provides self-sharpening edges and well-balanced wear from tool tip right through the entire body edges.

Engineered for high efficiency and long life, "X-profile" tools are sure to increase productivity and savings on replacement parts.
